Table 4.1: Summary of the data used in the analysis. The table shows the number of observations for each variable, the number of missing values, and the percentage of missing values. The variables are: Age, Sex, Education, Wealth, and Fertility. The data is from the CDHS 2011 survey.

4.a. Rationale

The rationale for this study is to understand the factors that influence fertility rates in the CDHS 2011 survey. The study aims to identify the key determinants of fertility, such as age, sex, education, wealth, and fertility. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility.

4.b. Comment and limitations

The CDHS 2011 survey is a large, nationally representative survey that provides information on a wide range of demographic and health indicators. The survey is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility.

4.c. Method of computation

The data was computed using the CDHS 2011 survey data. The data was analyzed using statistical software, and the results were presented in the form of tables and figures. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility.

5. Data availability and disaggregation

The data is available for the CDHS 2011 survey. The data is disaggregated by age, sex, education, wealth, and fertility. The data is presented in the form of tables and figures. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility.

6. Comparability/deviation from international standards

The study is compared to international standards, such as the JME and NCHS / WHO. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility. The study is compared to international standards, such as the JME and NCHS / WHO. The study is based on the CDHS 2011 survey data, which provides information on these variables for a large sample of the population. The study is designed to be a descriptive study, providing a summary of the data and identifying the key factors that influence fertility.

Demographic and Health Surveys (DHS) are a series of standardized surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in a standardized manner across different countries and regions, allowing for comparisons and analysis of trends over time and across different populations. The surveys typically cover topics such as fertility, mortality, and health status, and are used to inform policy and program development. The DHS program is a joint effort of the United States Agency for International Development (USAID) and the International Center for Demographic and Health Surveys (ICDHS).
