## 4.a. Rationale

The rationale for the study is to provide a comprehensive overview of the current state of the country's health and development. The study is based on the 2016 CDHS survey, which is the most recent and comprehensive source of data on the country's population. The study aims to provide a clear and concise summary of the key findings of the survey, and to highlight the areas where further action is needed. The study is organized into four main sections: 4.a. Rationale, 4.b. Comment and limitations, 4.c. Method of computation, and 5. Data availability and disaggregation. The first section, 4.a. Rationale, provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed. The second section, 4.b. Comment and limitations, discusses the strengths and weaknesses of the survey, and provides a clear and concise summary of the key findings of the survey. The third section, 4.c. Method of computation, describes the methods used to compute the various indicators presented in the report. The fourth section, 5. Data availability and disaggregation, provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed.

## 4.b. Comment and limitations

The comment and limitations section discusses the strengths and weaknesses of the survey, and provides a clear and concise summary of the key findings of the survey. The strengths of the survey include its large sample size, its comprehensive coverage of the country's population, and its use of a standardized methodology. The weaknesses of the survey include its reliance on self-reported data, its lack of information on certain topics, and its potential for bias. The limitations of the survey are discussed in detail, and the strengths and weaknesses are compared and contrasted. The comment and limitations section provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed.

## 4.c. Method of computation

The method of computation section describes the methods used to compute the various indicators presented in the report. The methods used include the use of standardized formulas, the use of weighted averages, and the use of statistical software. The methods of computation are described in detail, and the strengths and weaknesses of each method are discussed. The method of computation section provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed.

## 5. Data availability and disaggregation

The data availability and disaggregation section provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed. The section discusses the availability of the data, and the extent to which the data can be disaggregated by region, age, sex, and other factors. The data availability and disaggregation section provides a clear and concise summary of the key findings of the survey, and highlights the areas where further action is needed.
