Table 4.1: Summary of the data used in the analysis. The table provides a detailed overview of the data sources, including the CDHS 2011, and the specific variables used in the analysis. The data is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

4.a. Rationale

The rationale for this study is to investigate the relationship between the variables of interest. The study is based on the CDHS 2011 data, which provides a comprehensive overview of the demographic and health status of the population. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

4.b. Comment and limitations

The study is based on the CDHS 2011 data, which provides a comprehensive overview of the demographic and health status of the population. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

4.c. Method of computation

The method of computation used in this study is based on the CDHS 2011 data. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

5. Data availability and disaggregation

The data used in this study is available from the CDHS 2011. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

6. Comparability/deviation from international standards

The study is based on the CDHS 2011 data, which provides a comprehensive overview of the demographic and health status of the population. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement. The study is based on the CDHS 2011 data, which provides a comprehensive overview of the demographic and health status of the population. The study aims to identify the factors that influence the outcome variable, and to provide a clear and concise summary of the findings. The study is presented in a structured format, with columns for the variable name, the data source, and the unit of measurement.

Demographic and Health Surveys (DHS) are a series of standardized surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in a standardized manner across different countries and regions, allowing for comparisons and analysis of trends over time and across different populations. The data collected from these surveys is used to inform policy and program development, as well as to monitor progress towards development goals.
