2.a. Definition and concepts

Maternal Mortality Ratio (MMR) is a measure of the number of maternal deaths per 100,000 live births. It is calculated by dividing the number of maternal deaths by the number of live births and multiplying by 100,000. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population.
