Table 4.1: Summary of the data used in the analysis. The table shows the number of observations for each variable, the number of missing values, and the percentage of missing values. The variables are: Age, Sex, Education, Wealth, and Fertility. The data is from the CDHS 2011 survey.

4.a. Rationale

The rationale for this analysis is to understand the relationship between the variables mentioned in the table. The analysis is based on the CDHS 2011 data. The variables are: Age, Sex, Education, Wealth, and Fertility. The data is from the CDHS 2011 survey.

4.b. Comment and limitations

The data used in this analysis is from the CDHS 2011 survey. The data is self-reported and may be subject to recall bias. The data is also from a cross-sectional survey, which limits the ability to make causal inferences.

4.c. Method of computation

The data was cleaned and prepared for analysis using Stata 14. The data was then analyzed using logistic regression.

5. Data availability and disaggregation

The data is available in the CDHS 2011 dataset. The data is disaggregated by age, sex, education, wealth, and fertility.

6. Comparability/deviation from international standards

The data is compared to international standards for fertility. The data is compared to the JME and NCHS / WHO standards. The data is compared to the Z score and the (10th percentile, 90th percentile) range.

Demographic and Health Surveys (DHS) are a series of population and household surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in a standardized manner across different countries and regions, allowing for comparisons and analysis of trends over time and across different populations. The data collected from these surveys is used to inform policy and program development, as well as to monitor progress towards development goals.
