4.a. Rationale

The rationale for this study is to provide a comprehensive overview of the current state of research on the topic of [topic]. The study is motivated by the need to understand the underlying factors that influence [outcome] and to identify potential interventions that can be implemented to improve [outcome]. The study is designed to be a systematic review of the literature, which involves identifying, appraising, and synthesizing the results of all relevant studies. The study is organized into four main sections: (1) Introduction, (2) Methods, (3) Results, and (4) Discussion. The Introduction provides a brief overview of the topic and the objectives of the study. The Methods section describes the search strategy, the selection criteria, and the data extraction process. The Results section presents the findings of the study, including the results of the meta-analysis. The Discussion section provides a summary of the findings and discusses the implications for practice and policy.

4.b. Comment and limitations

The comment and limitations of this study are as follows. The comment is that the study provides a comprehensive overview of the current state of research on the topic of [topic]. The limitations are that the study is a systematic review of the literature, which may not include all relevant studies, and that the study is based on self-reported data, which may be subject to bias. The study is limited by the quality of the included studies, the heterogeneity of the studies, and the potential for publication bias. The study is also limited by the lack of information on the underlying mechanisms that influence [outcome].

4.c. Method of computation

The method of computation for this study is as follows. The data were extracted from the included studies and entered into a database. The data were then analyzed using a meta-analysis technique, which involves combining the results of the individual studies to produce a pooled estimate of the effect size. The pooled estimate was then used to calculate the confidence interval. The results of the meta-analysis are presented in the Results section of the study.

5. Data availability and disaggregation

The data for this study are available from the CDHS 2016 Data Report (English). The data are disaggregated by sex, age, and education level. The data are also disaggregated by region and by household type. The data are available in both English and Swahili. The data are available for download from the CDHS website.
