4.b. Comment and limitations

The data presented in this report are based on the results of the Demographic and Health Survey (DHS) conducted in 2018. The survey was designed to provide information on a wide range of demographic and health indicators. However, there are several limitations to the data that should be noted. First, the survey was a cross-sectional study, which means that it only provides a snapshot of the population at a single point in time. Second, the survey was conducted in a household-based format, which may not capture information on individuals who are not at home or who are in institutional settings. Third, the survey used self-reported data, which may be subject to recall bias or social desirability bias. Finally, the survey was conducted in a specific geographic area, which may not be representative of the entire population.

4.c. Method of computation

The data were computed using the DHS software package, which includes a series of standard procedures for data management and analysis. The software package is designed to handle large datasets and to produce a wide range of statistical outputs. The results presented in this report were generated using the standard procedures included in the software package.

5. Data availability and disaggregation

The data presented in this report are available in a disaggregated format, allowing for analysis by sex, age, and other demographic characteristics. The data are also available in a disaggregated format by educational level, marital status, and other factors. The data are presented in a series of tables, which provide a detailed breakdown of the results. The data are also available in a disaggregated format by region, allowing for analysis of regional differences.

6. Comparability/deviation from international standards

The data presented in this report are comparable to international standards, as they are based on the same survey methodology and data collection procedures. The data are also comparable to international standards in terms of the indicators measured, which are consistent with the standards set by the Demographic and Health Surveys (DHS) program. The data are also comparable to international standards in terms of the results, which are similar to those reported in other DHS reports. However, there are some deviations from international standards that should be noted. First, the survey was conducted in a specific geographic area, which may not be representative of the entire population. Second, the survey used self-reported data, which may be subject to recall bias or social desirability bias. Finally, the survey was conducted in a household-based format, which may not capture information on individuals who are not at home or who are in institutional settings.
