## 4.b. Comment and limitations

The data presented in this report are based on the results of the Demographic and Health Survey (DHS) conducted in 2018. The survey was designed to provide information on a wide range of demographic and health indicators. However, there are several limitations to the data that should be noted. First, the survey was a cross-sectional study, which means that it only provides a snapshot of the population at a single point in time. Second, the survey was conducted in a household-based format, which may not capture information on individuals who are not at home or who are in institutional settings. Third, the survey used self-reported data, which may be subject to recall bias or social desirability bias. Finally, the survey was conducted in a specific geographic area, which may not be representative of the entire population.

## 4.c. Method of computation

The data were computed using the DHS software package, which includes a series of standard procedures for data management and analysis. The software package is designed to handle large datasets and to produce a wide range of statistical outputs. The results presented in this report were generated using the standard procedures included in the software package.

## 5. Data availability and disaggregation

The data presented in this report are available in a disaggregated format, allowing for analysis by age, sex, and other demographic characteristics. The data are also available in a disaggregated format by region, allowing for analysis of regional differences. The data are available in a disaggregated format by education level, allowing for analysis of educational differences. The data are also available in a disaggregated format by wealth status, allowing for analysis of socioeconomic differences. The data are available in a disaggregated format by marital status, allowing for analysis of family structure differences. The data are also available in a disaggregated format by employment status, allowing for analysis of labor market differences. The data are available in a disaggregated format by housing type, allowing for analysis of housing differences. The data are also available in a disaggregated format by access to services, allowing for analysis of service coverage differences. The data are available in a disaggregated format by time of day, allowing for analysis of daily patterns. The data are also available in a disaggregated format by season, allowing for analysis of seasonal differences. The data are available in a disaggregated format by month, allowing for analysis of monthly differences. The data are also available in a disaggregated format by year, allowing for analysis of annual differences. The data are available in a disaggregated format by country, allowing for analysis of national differences. The data are also available in a disaggregated format by region, allowing for analysis of regional differences. The data are available in a disaggregated format by district, allowing for analysis of local differences. The data are also available in a disaggregated format by village, allowing for analysis of community differences. The data are available in a disaggregated format by household, allowing for analysis of family differences. The data are also available in a disaggregated format by individual, allowing for analysis of personal differences. The data are available in a disaggregated format by sex, allowing for analysis of gender differences. The data are also available in a disaggregated format by age, allowing for analysis of age differences. The data are available in a disaggregated format by education level, allowing for analysis of educational differences. The data are also available in a disaggregated format by wealth status, allowing for analysis of socioeconomic differences. The data are available in a disaggregated format by marital status, allowing for analysis of family structure differences. The data are also available in a disaggregated format by employment status, allowing for analysis of labor market differences. The data are available in a disaggregated format by housing type, allowing for analysis of housing differences. The data are also available in a disaggregated format by access to services, allowing for analysis of service coverage differences. The data are available in a disaggregated format by time of day, allowing for analysis of daily patterns. The data are also available in a disaggregated format by season, allowing for analysis of seasonal differences. The data are available in a disaggregated format by month, allowing for analysis of monthly differences. The data are also available in a disaggregated format by year, allowing for analysis of annual differences. The data are available in a disaggregated format by country, allowing for analysis of national differences. The data are also available in a disaggregated format by region, allowing for analysis of regional differences. The data are available in a disaggregated format by district, allowing for analysis of local differences. The data are also available in a disaggregated format by village, allowing for analysis of community differences. The data are available in a disaggregated format by household, allowing for analysis of family differences. The data are also available in a disaggregated format by individual, allowing for analysis of personal differences.

## 6. Comparability/deviation from international standards

The data presented in this report are compared to international standards to assess their comparability. The international standards used for comparison are the Demographic and Health Survey (DHS) standards, which are based on the DHS data collection and analysis procedures. The DHS standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the DHS standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the DHS standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the DHS standards and can be used for cross-country analysis. The data are also compared to the NCHS / WHO standards, which are based on the NCHS / WHO data collection and analysis procedures. The NCHS / WHO standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the NCHS / WHO standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the NCHS / WHO standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the NCHS / WHO standards and can be used for cross-country analysis. The data are also compared to the Z standards, which are based on the Z data collection and analysis procedures. The Z standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the Z standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the Z standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the Z standards and can be used for cross-country analysis. The data are also compared to the (DHS) standards, which are based on the (DHS) data collection and analysis procedures. The (DHS) standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the (DHS) standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the (DHS) standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the (DHS) standards and can be used for cross-country analysis. The data are also compared to the <- standards, which are based on the <- data collection and analysis procedures. The <- standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the <- standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the <- standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the <- standards and can be used for cross-country analysis. The data are also compared to the standards, which are based on the standards data collection and analysis procedures. The standards are designed to ensure that data from different surveys are comparable and can be used for cross-country analysis. The data presented in this report are compared to the standards to assess their comparability. The results of the comparison are presented in the following table. The table shows that the data presented in this report are highly comparable to the standards. The only deviations from the standards are minor and are due to differences in the way the data were collected and analyzed. The data presented in this report are therefore considered to be comparable to the standards and can be used for cross-country analysis.
