Table 4.1: Summary of the data used in the analysis. The table shows the number of women and children in the sample, the number of women who were interviewed, and the number of children who were interviewed. The table also shows the number of women who were interviewed who were not interviewed in the 2005 survey, and the number of children who were interviewed who were not interviewed in the 2005 survey.

#### 4.a. Rationale

The rationale for the analysis is to provide a comprehensive overview of the data used in the analysis. The table shows the number of women and children in the sample, the number of women who were interviewed, and the number of children who were interviewed. The table also shows the number of women who were interviewed who were not interviewed in the 2005 survey, and the number of children who were interviewed who were not interviewed in the 2005 survey.

#### 4.b. Comment and limitations

The comment and limitations section discusses the strengths and weaknesses of the data. The strengths include the large sample size, the high response rate, and the use of a nationally representative sample. The limitations include the fact that the data are self-reported, the fact that the data are from a single survey, and the fact that the data are from a single country.

#### 4.c. Method of computation

The method of computation section describes the methods used to compute the estimates. The methods include the use of a complex survey design, the use of a weighting system, and the use of a statistical software package.

### 5. Data availability and disaggregation

The data availability and disaggregation section discusses the availability of the data and the ability to disaggregate the data by various characteristics. The data are available for all 15 countries, and the data can be disaggregated by age, sex, and education level.

### 6. Comparability/deviation from international standards

The comparability/deviation from international standards section discusses the comparability of the data with international standards. The data are compared to the JME standards, the NCHS / WHO standards, and the Z standards. The data are found to be comparable to the JME standards, but there are some deviations from the NCHS / WHO standards and the Z standards.

Demographic and Health Surveys (DHS) are a series of nationally representative surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in many developing countries and are used to monitor progress towards the Millennium Development Goals (MDGs). The DHS surveys are conducted by the Demographic and Health Surveys Program, which is a joint effort of the United States Agency for International Development (USAID) and the Demographic and Health Surveys Program of the United Nations Population Fund (UNFPA).
