4.a. *Rationale*

[illegible]

4.b. Comment and limitations

The data sources used in the analysis are summarized in Table 1. The data sources are categorized into three main groups: (1) National accounts, (2) Household surveys, and (3) Administrative data. National accounts data are obtained from the National Accounts of the United States (NAUS) and the National Accounts of the United Kingdom (NAUK). Household survey data are obtained from the Panel Study of Income Dynamics (PSID) and the British Household Panel Survey (BHPS). Administrative data are obtained from the Social Security Administration (SSA) and the Department for Work and Pensions (DWP). The data sources are used to estimate the parameters of the model and to evaluate the model's performance.

4.c. Method of computation

The model is solved using the method of undetermined coefficients. The model is linearized around the steady state and the resulting system of equations is solved using the method of undetermined coefficients.

4.d. Validation

The model is validated using the method of moments. The method of moments is used to estimate the parameters of the model and to evaluate the model's performance.

4.i. Quality management

NIS (National Income and Product Accounts) data are used to estimate the parameters of the model. The data are obtained from the National Accounts of the United States (NAUS) and the National Accounts of the United Kingdom (NAUK). The data are used to estimate the parameters of the model and to evaluate the model's performance.

5. Data availability and disaggregation

The data are available for the years 1980-2000. The data are disaggregated into three main categories: (1) National accounts, (2) Household surveys, and (3) Administrative data.

6. Comparability/deviation from international standards

The data are compared to international standards. The data are obtained from the National Accounts of the United States (NAUS) and the National Accounts of the United Kingdom (NAUK). The data are used to estimate the parameters of the model and to evaluate the model's performance.
