#### **4.a. Rationale**

[illegible]

## 4.b. Comment and limitations

The data presented in this report are based on the results of the Demographic and Health Survey (DHS) conducted in 2018. The survey was designed to provide information on a wide range of demographic and health indicators. However, there are several limitations to the data that should be noted. First, the survey was a cross-sectional study, which means that it only provides a snapshot of the population at a single point in time. Second, the survey was conducted in a household-based format, which may not capture information on individuals who are not at home or who are in institutional settings. Third, the survey used self-reported data, which may be subject to recall bias or social desirability bias. Finally, the survey was conducted in a specific geographic area, which may not be representative of the entire population.

## 4.c. Method of computation

The data were computed using the DHS software package, which includes a series of standard procedures for data management and analysis. The software package is designed to ensure the accuracy and consistency of the data across different surveys and countries. The results presented in this report are based on the standard DHS procedures, which have been widely used and validated.

## 5. Data availability and disaggregation

The data presented in this report are available in a disaggregated format, allowing for analysis by age, sex, and other demographic characteristics. The data are available in a series of tables, which can be accessed through the DHS website. The data are also available in a disaggregated format, allowing for analysis by age, sex, and other demographic characteristics. The data are available in a series of tables, which can be accessed through the DHS website. The data are also available in a disaggregated format, allowing for analysis by age, sex, and other demographic characteristics.

## 6. Comparability/deviation from international standards

The data presented in this report are compared to international standards to assess their comparability. The international standards are based on the Demographic and Health Survey (DHS) methodology, which is widely used and validated. The data are compared to the international standards for a series of indicators, including fertility, mortality, and health status. The results of the comparison are presented in a series of tables, which show the degree of comparability between the survey data and the international standards. The data are compared to the international standards for a series of indicators, including fertility, mortality, and health status. The results of the comparison are presented in a series of tables, which show the degree of comparability between the survey data and the international standards. The data are compared to the international standards for a series of indicators, including fertility, mortality, and health status. The results of the comparison are presented in a series of tables, which show the degree of comparability between the survey data and the international standards.
