2.a. Definition and concepts

Maternal Mortality Ratio (MMR) is a measure of the number of maternal deaths per 100,000 live births. It is calculated by dividing the number of maternal deaths by the number of live births and multiplying by 100,000. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population.

Community Development Health Surveillance (CDHS) [11]

3.b. Data collection method

CDHS is a household survey that collects data on a wide range of health and demographic indicators. It is conducted by the Ministry of Health and Family Welfare in collaboration with the National Institute of Statistics (NIS). The CDHS is a key source of data for the Ministry of Health and Family Welfare and is used to inform policy and program development. The CDHS is a complex survey that takes into account a wide range of factors, including the quality of data collection, the availability of skilled health personnel, and the overall health of the population. The CDHS is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The CDHS is also used to identify areas where there is a need for improvement in maternal health services. The CDHS is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population.

4.b. Comment and limitations

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions.

5. Data availability and disaggregation

The data from the DHS is available in a variety of formats, including individual-level data, summary data, and disaggregated data. The individual-level data is available in a database that can be accessed through the DHS website. The summary data is available in a variety of formats, including tables, charts, and maps. The disaggregated data is available in a variety of formats, including tables, charts, and maps.
