2.a. Definition and concepts

Maternal Mortality Ratio (MMR) is a measure of the number of maternal deaths per 100,000 live births. It is calculated by dividing the number of maternal deaths by the number of live births and multiplying by 100,000. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health services. The MMR is a complex indicator that takes into account a wide range of factors, including the quality of maternal health services, the availability of skilled health personnel, and the overall health of the population.

2.b. Unit of measure

per 100,000 live births [111]

3.a. Data sources

Demographic and Health Surveys (DHS) [111]

3.b. Data collection method

CDHS is a national survey conducted by the Ministry of Health. It is a large-scale survey that collects data on a wide range of topics, including reproductive health, maternal health, and child health. The CDHS is conducted every five years and is one of the largest surveys in the world. The CDHS is a complex survey that takes into account a wide range of factors, including the quality of data collection, the availability of skilled health personnel, and the overall health of the population. The CDHS is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The CDHS is also used to identify areas where there is a need for improvement in maternal health services. The CDHS is a complex indicator that takes into account a wide range of factors, including the quality of data collection, the availability of skilled health personnel, and the overall health of the population.

4.b. Comment and limitations

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and includes information on fertility, mortality, and other health-related issues. The data is used to monitor and evaluate the progress of development goals and to inform policy and program decisions.

5. Data availability and disaggregation

Demographic and Health Survey (DHS) data is available for a wide range of countries and regions. The data is disaggregated by age, sex, and other demographic factors. The data is available in a variety of formats, including printed reports, electronic data files, and interactive web-based tools. The data is also available for use in a variety of applications, including research, policy analysis, and program evaluation.
