

0.a. Goal

0.a. Goal: To ensure that all people have access to basic services and that the environment is protected and improved.

0.b. Target

0.b. Target: To ensure that all people have access to basic services and that the environment is protected and improved. This target is achieved when the following conditions are met: (i) all people have access to basic services; (ii) the environment is protected and improved; (iii) the environment is protected and improved.

0.c. Indicator

0.c. Indicator: The indicator measures the extent to which all people have access to basic services and that the environment is protected and improved.

0.d. Series

0.d. Series: The series consists of the following components: (i) the indicator; (ii) the target; (iii) the goal.

0.e. Metadata update

0.e. Metadata update: The metadata update is the process of updating the metadata of the indicator.

0.f. Related indicators

0.f. Related indicators: The related indicators are the indicators that are related to the indicator. These indicators are: (i) the indicator; (ii) the target; (iii) the goal.

1.a. Organisation

1.a. Organisation: The organisation is the National Institute of Statistics (NIS) of the country.

1.b. Contact person(s)

1.b. Contact person(s): The contact person(s) is the person(s) who is responsible for the indicator.

1.c. Contact organisation unit

1.c. Contact organisation unit: The contact organisation unit is the unit of the organisation that is responsible for the indicator.

4.a. Rationale

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.

4.c. Method of computation

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.

4.d. Validation

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.

5. Data availability and disaggregation

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.

6. Comparability/deviation from international standards

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.

7. References and Documentation

[1] Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and covers a wide range of topics, including fertility, mortality, and health status. The data collected from the survey is used to monitor and evaluate the progress of development programs and to inform policy decisions. The survey is conducted in a standardized manner, allowing for comparisons between different countries and over time. The data is made available to the public through a variety of channels, including the DHS website and data archives.
