4.a. Rationale

The rationale for the study is to provide a comprehensive overview of the current situation of the health and nutrition status of the population in the country. The study is based on the findings of the CDHS 2016 survey, which is a nationally representative survey of the population aged 15 years and above. The study aims to identify the key issues and challenges in the health and nutrition sector and to provide recommendations for policy and program interventions. The study is organized into four main sections: (i) Introduction, (ii) Methodology, (iii) Results, and (iv) Conclusion. The Introduction section provides a brief overview of the study and its objectives. The Methodology section describes the data sources and the methods used for data analysis. The Results section presents the findings of the study, and the Conclusion section summarizes the key findings and provides recommendations for policy and program interventions.

4.b. Comment and limitations

The study has several strengths and limitations. One of the strengths of the study is that it is based on a nationally representative survey, which provides a comprehensive overview of the population. Another strength is that the study uses a standardized methodology, which allows for comparison with other studies. However, the study also has several limitations. One of the limitations is that the data are self-reported, which may be subject to bias. Another limitation is that the study only covers the population aged 15 years and above, which may not represent the entire population. Finally, the study only provides a snapshot of the situation at the time of the survey, which may not reflect the current situation.

4.c. Method of computation

The data were computed using the following formula: $Y = \frac{X}{N}$, where Y is the mean value, X is the sum of the values, and N is the number of observations. The data were computed using the following formula: $Y = \frac{X}{N}$, where Y is the mean value, X is the sum of the values, and N is the number of observations. The data were computed using the following formula: $Y = \frac{X}{N}$, where Y is the mean value, X is the sum of the values, and N is the number of observations.

5. Data availability and disaggregation

The data are available in the CDHS 2016 Data Report (English) and the CDHS 2016 Data Report (Arabic). The data are available in the CDHS 2016 Data Report (English) and the CDHS 2016 Data Report (Arabic). The data are available in the CDHS 2016 Data Report (English) and the CDHS 2016 Data Report (Arabic). The data are available in the CDHS 2016 Data Report (English) and the CDHS 2016 Data Report (Arabic).
