2.a. Definition and concepts

Definition and concepts are the foundation of any research. They provide a clear understanding of the variables being studied and the relationships between them. In this section, we will define the key concepts used in this study and explain how they are related to each other. The first concept is the independent variable, which is the variable that is manipulated or controlled by the researcher. The second concept is the dependent variable, which is the variable that is measured or observed. The third concept is the control variable, which is the variable that is held constant to ensure that the results are due to the independent variable. The fourth concept is the confounding variable, which is a variable that can affect the dependent variable and is not controlled for. The fifth concept is the mediating variable, which is a variable that explains the relationship between the independent and dependent variables. The sixth concept is the moderating variable, which is a variable that affects the strength or direction of the relationship between the independent and dependent variables. The seventh concept is the outcome variable, which is the final result of the study. The eighth concept is the research hypothesis, which is a statement that predicts the relationship between the independent and dependent variables. The ninth concept is the research question, which is a question that the study aims to answer. The tenth concept is the research objective, which is the purpose of the study.

Primary data sources (CSES) []

3.b. Data collection method

Data collection methods are the techniques used to gather data for a study. In this section, we will describe the data collection method used in this study. The data were collected using a survey method. The survey was administered online and consisted of a series of questions designed to measure the variables of interest. The survey was distributed to a sample of the population, and the responses were collected and analyzed. The sample was selected using a random sampling method, which ensures that the results are representative of the population. The survey was administered using a computer program that automatically generated the survey questions and collected the responses. The data were then entered into a database and analyzed using statistical software. The data collection method used in this study is a self-administered online survey. The survey was distributed to a sample of the population, and the responses were collected and analyzed. The sample was selected using a random sampling method, which ensures that the results are representative of the population. The survey was administered using a computer program that automatically generated the survey questions and collected the responses. The data were then entered into a database and analyzed using statistical software. The data collection method used in this study is a self-administered online survey.
