Table 4.1: Summary of the data used in the analysis. The table provides a detailed overview of the data sources, including the CDHS 2011, the JME, and the NCHS/WHO, and the specific variables used in the analysis.

#### 4.a. Rationale

The rationale for this study is to investigate the relationship between the CDHS 2011 and the JME. The study aims to identify the factors that influence the relationship between the two datasets and to provide a comprehensive overview of the data used in the analysis. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets.

#### 4.b. Comment and limitations

The CDHS 2011 is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets.

#### 4.c. Method of computation

The method of computation used in this study is based on the CDHS 2011 and the JME. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets.

### 5. Data availability and disaggregation

The data used in this study is available from the CDHS 2011 and the JME. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets.

### 6. Comparability/deviation from international standards

The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets. The study is based on the CDHS 2011, which is a large-scale survey of the population of the country. The JME is a smaller-scale survey that focuses on a specific aspect of the population. The study is designed to provide a detailed analysis of the data and to identify the factors that influence the relationship between the two datasets.

Demographic and Health Surveys (DHS) are a series of standardized surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in many countries around the world and are used to monitor population trends and health status. The DHS program is a joint effort of the United States Agency for International Development (USAID) and the United Nations Population Fund (UNFPA). The surveys are conducted by national statistical agencies and are designed to be representative of the population. The data collected from these surveys are used to inform policy and program development. The DHS program has been instrumental in providing data on a wide range of issues, including fertility, mortality, and health status. The data are used to inform policy and program development and to monitor progress towards development goals. The DHS program is a valuable source of information for a wide range of stakeholders, including policymakers, researchers, and the public.
