4.a. Rationale

The rationale for the study is to provide a comprehensive overview of the current state of the country's health and development. The study is based on the assumption that the data collected from the CDHS 2016 survey is representative of the population. The study aims to identify the key challenges and opportunities for the country's health and development. The study is organized into four main sections: (1) Introduction, (2) Data availability and disaggregation, (3) Method of computation, and (4) Comment and limitations. The study is based on the assumption that the data collected from the CDHS 2016 survey is representative of the population. The study aims to identify the key challenges and opportunities for the country's health and development. The study is organized into four main sections: (1) Introduction, (2) Data availability and disaggregation, (3) Method of computation, and (4) Comment and limitations.

4.b. Comment and limitations

The comment and limitations section discusses the strengths and weaknesses of the study. The strengths of the study include the use of a nationally representative sample and the inclusion of a wide range of indicators. The limitations of the study include the potential for non-response bias and the lack of information on certain variables. The study is based on the assumption that the data collected from the CDHS 2016 survey is representative of the population. The study aims to identify the key challenges and opportunities for the country's health and development. The study is organized into four main sections: (1) Introduction, (2) Data availability and disaggregation, (3) Method of computation, and (4) Comment and limitations.

4.c. Method of computation

The method of computation section describes the methods used to calculate the indicators. The indicators are calculated using the data from the CDHS 2016 survey. The methods used include the use of the following formulas: (1) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}}$, (2) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}} \times 100$, and (3) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}} \times 1000$. The study is based on the assumption that the data collected from the CDHS 2016 survey is representative of the population. The study aims to identify the key challenges and opportunities for the country's health and development. The study is organized into four main sections: (1) Introduction, (2) Data availability and disaggregation, (3) Method of computation, and (4) Comment and limitations.

5. Data availability and disaggregation

The data availability and disaggregation section discusses the availability of the data and the disaggregation of the data by sex, age, and region. The data is available for the following indicators: (1) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}}$, (2) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}} \times 100$, and (3) $\text{Indicator} = \frac{\text{Number of people with condition}}{\text{Total population}} \times 1000$. The study is based on the assumption that the data collected from the CDHS 2016 survey is representative of the population. The study aims to identify the key challenges and opportunities for the country's health and development. The study is organized into four main sections: (1) Introduction, (2) Data availability and disaggregation, (3) Method of computation, and (4) Comment and limitations.
