2.a. Definition and concepts

Maternal Mortality Ratio (MMR) is a measure of the number of maternal deaths per 100,000 live births. It is calculated by dividing the number of maternal deaths by the number of live births and multiplying by 100,000. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health. The MMR is a complex indicator that takes into account many factors, including the quality of care, the availability of resources, and the cultural context. It is a useful tool for policymakers and researchers alike. The MMR is a key indicator of the health of a population, particularly in terms of reproductive health. It is used to compare the health of different countries and to track progress over time. The MMR is also used to identify areas where there is a need for improvement in maternal health. 3.a. Data sources

Maternal Mortality Ratio (MMR) (CDHS) [100]

3.b. Data collection method

CDHS is a national household survey conducted by the Ministry of Health. It is a large-scale survey that covers the entire country. The survey is conducted in a representative sample of households. The survey is conducted in a way that is respectful of the cultural context and the privacy of the respondents. The survey is conducted in a way that is easy for the respondents to understand and participate in. The survey is conducted in a way that is consistent with international standards. The survey is conducted in a way that is transparent and accountable. The survey is conducted in a way that is timely and relevant. The survey is conducted in a way that is useful for policymakers and researchers alike. The survey is conducted in a way that is a key indicator of the health of a population, particularly in terms of reproductive health. 4.b. Comment and limitations

Demographic and Health Survey (DHS) is a household survey that provides information on a wide range of demographic and health indicators. The survey is conducted in a representative sample of households and includes information on fertility, mortality, and other health-related issues. The data is used to monitor and evaluate the progress of development programs and to inform policy-making.

5. Data availability and disaggregation

Demographic and Health Survey (DHS) data is available for a wide range of countries and regions. The data is disaggregated by age, sex, and other demographic factors. The data is available in both English and French. The data is used to monitor and evaluate the progress of development programs and to inform policy-making.
