Table 4.1: Summary of the data used in the analysis. The table shows the number of observations for each variable, the number of missing values, and the percentage of missing values. The variables are: Age, Sex, Education, Wealth, and Fertility. The data is from the CDHS 2011.

4.a. Rationale

The rationale for this study is to understand the factors that influence fertility rates in the CDHS 2011. The study focuses on the relationship between age, sex, education, wealth, and fertility. The data is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study aims to provide a comprehensive overview of the factors that influence fertility rates in the CDHS 2011.

4.b. Comment and limitations

The data used in this study is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study focuses on the relationship between age, sex, education, wealth, and fertility. The data is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study aims to provide a comprehensive overview of the factors that influence fertility rates in the CDHS 2011.

4.c. Method of computation

The data used in this study is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study focuses on the relationship between age, sex, education, wealth, and fertility. The data is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study aims to provide a comprehensive overview of the factors that influence fertility rates in the CDHS 2011.

5. Data availability and disaggregation

The data used in this study is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study focuses on the relationship between age, sex, education, wealth, and fertility. The data is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study aims to provide a comprehensive overview of the factors that influence fertility rates in the CDHS 2011.

6. Comparability/deviation from international standards

The data used in this study is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study focuses on the relationship between age, sex, education, wealth, and fertility. The data is from the CDHS 2011, which is a nationally representative survey of the population of the CDHS 2011. The study aims to provide a comprehensive overview of the factors that influence fertility rates in the CDHS 2011. The study compares the results of the CDHS 2011 with international standards, such as the NCHS / WHO and the JME. The study finds that the results of the CDHS 2011 are generally consistent with international standards, but there are some deviations. The study also discusses the reasons for these deviations and provides recommendations for future research.

Demographic and Health Surveys (DHS) are a series of standardized surveys that provide information on a wide range of demographic and health indicators. These surveys are conducted in a standardized manner across different countries and regions, allowing for comparisons and analysis of trends over time and across different populations. The surveys typically cover topics such as fertility, mortality, and health status, and are used to inform policy and program development. The DHS program is a joint effort of the United States Agency for International Development (USAID) and the United Nations Population Fund (UNFPA).
